RESEARCH VISION

AI-Driven Multiphysics Design and Optimization

I investigate how AI can discover high-performance designs that satisfy complex physical constraints. My background spans thermal-fluid, electromagnetic, and structural analysis; my current work includes BiSTO for turbulent cooling-channel topology optimization. My long-term goal is to develop reusable design methods across physical systems and connect them with manufacturing and experimental validation, with a focus on nuclear energy systems.

Publications: 14 SCIE journal articles (13 first or co-first author; 5 corresponding author; 11 in JCR Q1 journals).

ACADEMIC APPOINTMENTS

Dec 2023 – Present
East Lansing, MI

Scientist | Facility for Rare Isotope Beams (FRIB), Michigan State University
High Power Targetry Department | Regular staff position, continuing-appointment track

- Developed BiSTO (Binary Surrogate-based Topology Optimization), an AI-driven framework combining surrogate-guided topology search, solver verification, and geometric connectivity constraints for turbulent cooling-channel design.
- Lead the overall fabrication and installation effort for the FRIB Rotating Beam Dump, coordinating specialists in materials, systems engineering, thermomechanics, and radiation, with implementation targeted for 2028.
- Developed a hybrid genetic algorithm–reinforcement learning approach for FRIB beam-dump design optimization, increasing simulated average power-handling capability by 72% over the existing design.
- Developed a CNN–MLP surrogate for rotating beam-dump thermal limits (2.8% mean error against FEM in cross-validation; millisecond-scale inference).

Aug 2021 – Dec 2023
Daejeon, Korea

Postdoctoral Researcher | Korea Atomic Energy Research Institute (KAERI)
Applied Artificial Intelligence Lab

- Developed a deep reinforcement learning approach for heat-exchanger optimization, achieving 14.8% higher simulated heat transfer than conventional topology optimization; tested a metal-printed prototype.
- Designed a single-body, 3D-printable DC electromagnetic pump with 52% lower simulated current demand than a helical pump at matched pressure and flow rate.
- Designed flow channels for Samsung OLED susceptors using reinforcement learning.
- Applied AI anomaly detection to the KOMAC accelerator for operational stability.

EDUCATION

Mar 2016 – Aug 2021
Ulsan, Korea

Ph.D. in Nuclear Engineering (Combined M.S./Ph.D.) | UNIST
Ulsan National Institute of Science and Technology | Advisor: Hee Reyoung Kim
Thesis: Optimization of Lithium Charge Stripper through MHD Circulator Development

Mar 2010 – Feb 2016
Ulsan, Korea

B.S. in Nuclear Engineering & Mechanical Engineering (Dual Major) | UNIST

TEACHING

Mentoring

(2026–Present) Kate Brown, undergraduate student, Michigan State University. Primary research mentor for experimental validation of the FRIB Rotating Beam Dump using electromagnetic induction heating, alongside electromagnetic, fluid-flow, and thermal simulations.

(2026–Present) Zhuoqun Wu, graduate student, Michigan State University. Research mentor for the application of reinforcement learning to wedge geometry optimization.

(2026) Adam Sypitkowski, undergraduate student, Michigan State University, Accelerator Science and Engineering Traineeship (ASET) program at FRIB. Research mentor for AI-driven geometry optimization for accelerator simulations.

Teaching Experience

(2023) Lecturer, Foundation of AI. International School on Beam Dynamics and Accelerator Technology.

(2016) Instructor, Nuclear Comprehensive Design Project. UNIST.

Teaching Assistant

(2021) Liquid Metal Magnetohydrodynamics I. UNIST.

(2020) Liquid Metal Magnetohydrodynamics II. UNIST.

(2019) Special Lecture on Nuclear Engineering (MHD electrical power generation). UNIST.

(2017–2019) Fundamental of Electromagnetics. UNIST.

ACHIEVEMENTS

Awards

(2019) Doosan Heavy Industries & Construction Research Scholarship. Korean Nuclear Society.

(2016) Excellent Poster Award. Korean Nuclear Society.

(2015) First Award of Excellence for MNE Research Internship. UNIST.

Software Registration

(2022) **Lee, G.**, Yu, Y., & Kim, T. Heat exchanger path generation program through reinforcement learning. Republic of Korea, Registration No. C-2022-049451.

Certification

(2021) Certified AI Expert, Korean Standards Association, No. C-2021-0004668.

SELECTED RESEARCH PROJECT EXPERIENCE

2023–2026
FRIB

AIP Mini-channel and Water Beam Dump
Developed a simulation-based optimization framework for beam-dump design, evaluated thermal performance, and contributed to engineering reviews of beam-dump hardware.

2023–2026
FRIB

AIP Post-target Shielding
Led thermal design reviews and high-power system thermal simulation for operation

2023–2026
FRIB

Accelerator Operation Labor
Thermal device simulation, optimization, validation, and operational support

2022
KAERI

Technical Support for AI-Based Improvement of Temperature Uniformity in Next-Generation Display Manufacturing Systems
Applied reinforcement learning to optimize flow-channel layouts for display susceptors.

2021–2023
KAERI

Development of Original 3D Printing Technology for Manufacturing Components of Small Nuclear Reactor Materials
Developed deep reinforcement learning models for heat-exchanger design; contributed to topology-optimization analysis and experimental validation of a metal-printed prototype.

2021–2023
KAERI

Establishment of Intelligent Operation Platform for HANARO and Research Facilities
Anomaly detection in the accelerator system using AI

2021–2022
Hyundai

Development of Deep Learning Solver for Reducing Iterations in Topology Optimization
Supported topology-optimization simulations for deep-learning solver development.

2020–2021
Institute for Basic Science

Research on the Development of Prototype Lithium Charge Stripper
Design optimization of an electromagnetic pump and liquid lithium film formation system

2018–2021 KEPCO Research Institute	**Plasma Generation Technology of High Temperature and Electric Production Technology of 10 kW Magnetic Generator** Investigation of MHD generator technology and design analysis
2016–2018 KAERI	**Design and Performance Evaluation about EM Pump for Test of Coolant Loop of Prototype Gen-IV Sodium-cooled Fast Reactor** Feasibility analysis and performance evaluation of DC electromagnetic pumps for SFR
2016 Institute for Basic Science	**Development of Prototype DC Electromagnetic Pump** Design optimization of a DC electromagnetic pump
